118、202、432系列喷嘴

SCHLICK Models 118, 202, 432

持久耐用— 适用于含研磨介质的雾化

SCHLICK硬质合金喷嘴雾化形状为空心锥,雾化面积大、雾化液滴细小,尤其适合含研磨介质的雾化,无论流体压力高还是低。

雾化流量、液滴分布等取决于喷孔的大小、流体压力、雾化角度、流体粘度和流体密度以及表面张力等因素。

当然,如需获得很小的雾化液滴,流体压力要尽量大些、流体粘度和表面张力尽量小一些,同时,喷孔直径尽量小些、雾化角度尽量大些。

由于流道截面大且畅通,喷嘴极不容易堵塞,工作压力可达150bar以上。

Extremely durable – also for abrasive media

SCHLICK hard metal nozzles with a hollow cone spray image atomize static liquids into very fine droplets with a large specific surface and are very well suited to atomizing **abrasive media** at high and low pressures.

The quality of the atomized spray and the droplet spectrum are related to the diameter of the hole, the pressure, the scatter cone, the density, the viscosity, and the surface tension.

In order to achieve fine atomisation high liquid pressures, low viscosities and surface tensions, small bore holes and a large spray cone should be aimed for.

There is a low blockage risk due to a large, free cross-section. We guarantee operating safety up to 150 bar.

流体在自身压力作用下, 通过喷孔或圆环进入涡流腔中, 在涡流腔中, 压力转换为动能或者旋转动能。

The liquid is fed under pressure and enters the swirl chamber through tangential slits or holes. In the swirl chamber, the energy in the pressurised liquid is converted into rotational energy or kinetic energy.

在喷嘴出口处, 旋转的液膜与周围的空气发生碰撞, 分解成细小液滴, 这些液滴沿轴向和径向远离喷嘴, 呈空心锥体状。

A rotating film of liquid forms around an air core and emerges through the hole as a hollow cone jet. After overcoming the surface tension, the cone disperses into a myriad of fine droplets.

此系列喷嘴的喷芯和涡流腔材质为硬质合金或者碳化硅, 更换很容易, 如需改变流量或者雾化角度, 更换喷芯和涡流腔即可, 这使得此系列的喷嘴能够满足不同客户的各种需求。

The nozzle exit, and swirl chambers are made of hard metal or silicon carbide. The hard metal units can be easily replaced. Air flow rate and spray cone can be varied by replacing the hard metal units. This makes it easy to adapt the system to customer-specific requirements by hand.
